# Power Module

- Buck regulator power module with integrated shielded inductor
- 36VDC input voltage, 1A output current
- SCP, OCP, OTP, and UVLO protection
- 3.0 x 5.0mm low profile QFN package
- Flip-chip technology for improved thermal management
- Enable, power good, soft start, and sync functions

# RECOM DC/DC Converter

## RPX-1.0

## 1.0 Amp QFN Package

### Description

The RPX-1.0 is a buck converter with an integrated inductor in a compact 3mm x 5mm x 1.6mm thermally-enhanced QFN package. The input range is from 4 to 36VDC, allowing 5V, 12V, or 24V supply voltages to be used. The output voltage can be set with two resistors in the range from 0.8 up to 30VDC. The output current is up to 1A and is fully protected against continuous short-circuits, output overcurrent, or over-temperature faults.

### OUTPUT VOLTAGE TRIMMING

The external resistor divider sets the output voltage (see *“Typical Application”*). The feedback resistor (R4) sets the feedback loop bandwidth with the internal compensation capacitor. R3 should be approximately 75k $\Omega$  when  $V_{OUT} \geq 1V$ . The values for trim resistors shown in trim tables below are according to standard E96 values; therefore, the specified voltage may slightly vary. R4 can then be calculated with below equation:

**Calculation:**

$$R4 = \frac{R3}{\frac{V_{OUT}}{V_{FB}} - 1}$$

**Example:**

$$R4 = \frac{75k}{\frac{1.5V}{0.807V} - 1} = 87k33\Omega$$

R4 according to E96  $\approx$  **86k6**

$V_{OUT}$	1.5V	1.8V	2.5V	3.3V	5V	12V	24V
$R_4$ (E96) $\approx$	86k6	60k4	35k7	24k3	14k3	5k36	2k61

#### Pad Information

Pad #	Function	Description
1	PG	Output power good. High = Vout at set level, low = Vout below nominal regulation. Leave floating if not used
2	CTRL/ SYNC	Pull high to enable the RPX-1.0. Leave open or connect to ground to disable the device. Apply external clock to synchronize switching frequency.
3	FB	Feedback input. Used to set the output voltage between 0.8V and 30VDC.
4	PGS	Power good source
6,7,8,12	SW	Switch node. Connect 6, 7, and 8 to large copper pad for optimal heat dissipation.
9,10,11	Vout	Output Voltage. Connect external capacitor between this pin and GND as close to the pins as possible.
13	DNC	Do not connect. Must be soldered to an isolated pad.
5,14,15	GND	Ground pins. Connect these pins to the power ground plane on the PCB
16	Vin	Input Voltage. Connect a low-ESR low-inductance external bypass capacitor between this pin and GND as close to the pins as possible
17	DNC	Do not connect. Leave Floating

Tolerances: according to ASME Y14.5M

- 1 Pb-Free assembly is recommended according to JEDEC J-STD020.
- 2 Ensure that the peak reflow temperature does not exceed 240°C ±5°C as per JEDEC J-STD020
- 3 The reflow time period during peak temperature of 240°C ±5°C should not exceed 30 seconds.
- 4 Reflow time above liquids (217°C) should not exceed 150 seconds.
- 5 For solder paste use a standard SAC Alloy such as SAC 305, type 3 or higher.
- 6 Other soldering methods (e.g. vapor-phase) are not verified and have to validate by the customer on his own risk.

**PCB LAYOUT SUGGESTION**

Efficient PCB layout, especially of the input capacitor placement, is critical for stable operation. For best results, refer to Figure 6, and follow the guidelines below.

1. Connect a large ground plane to GND pins 14 and 15 directly. If the bottom layer is a ground plane, add vias near GND.
2. Ensure that the high-current paths at GND and VIN have short, direct, and wide traces.
3. Place the ceramic input capacitor close to VIN and GND.
4. Keep the connection of the input capacitor and VIN as short and wide as possible.
5. Place the external feedback resistors next to FB.
6. Feedback and switch node should be placed as far away from one another as possible.
